Risk Analysis

Absolute Volatility	13.29%
Relative Volatility	1.34
Tracking Error	4.78%
Sharpe Ratio	1.03

Relative Performance Summary

Information Ratio	-0.10
Jensen Alpha	1.35%
Beta	0.87
R ²	0.89

Note: Against Index over 3 years

Additional Information

The Tracking Error is likely to be higher than expected due to a mismatch in the timing of the fund and the index.

²The reason why a Historic Yield is estimated is because the fund moved from semi-annual distributions to quarterly distributions making the Historic Yield materially unrepresentative due to the way it is calculated. Income and charges have been estimated by dividing the Historic Yield by the number of quarters of distribution included in the calculation. All or some of the expenses charged to this fund are being charged to capital according to the provisions stated in the prospectus.

Citywire's exclusive methodology ranks fund managers according to their individual track record, rather than simply the performance of the fund they currently run. They look at how much risk managers have taken to produce their returns. A manager who takes lots of risk to produce good returns would be in danger of failing to deliver those results in the future. Ratings as per last month.

Standard & Poor's Fund Services is an independent company that awards ratings based on a wide variety of factors including performance, fund management style, overall investment process, corporate profile and stability of investment team. Fund Management Ratings range from 'A' to 'AAA'.

Investment Management Association (IMA) is the trade body representing the UK investment management industry.

Please refer to further Risk Warnings and Glossary at the rear of this document.

Risk Warnings

Market Risk: The value of investments can fall as well as rise and investors might not get back the sum originally invested, especially if investments are not held for the long term.

Currency Risk: Where investments are made in assets that are denominated in foreign currency, changes in exchange rates may affect the value of the investments.

Volatility Risk: The fund may exhibit significant price volatility.

Summarised Glossary

In addition to the above specific risk warnings applicable to the fund, the second page of the factsheet includes a number of statistical measures that should also assist investors and/or their advisors in selecting funds that meets both their investment objectives and appetite for risk.

SHARPE RATIO: This measure is a risk-adjusted return statistic. It measures the fund's return over and above cash (excess return over a risk free asset) divided by the absolute volatility of the fund. It shows the trade-off between risk and return. The greater the result, the better the return the fund has delivered given the risks within the fund.

ABSOLUTE VOLATILITY: One of the main ways in which the risk of an investment is measured is calculating the degree to which its value fluctuates around an average. The standard method for calculating this volatility is standard deviation. Absolute volatility is the standard deviation of the fund's last three years' performance which is then expressed as a percentage. All the other risk measures below are also based on the last 3 year's fund performance.

AVERAGE LIFE: This is the weight adjusted average life of the bonds held in the portfolio i.e. on average how many years to go before their expected redemption.

BETA: This is a measure of the volatility of the fund relative to its benchmark. A figure greater than 1 indicates that the fund will tend to outperform in a rising market and under perform in a falling one. I.e. is more volatile than the market. The reverse applies to a Beta of less than 1.

INFORMATION RATIO: This statistic is commonly used to measure a fund manager's skill against the benchmark. The out/underperformance of the fund relative to its peer group is divided by the tracking error. Therefore, anything positive is above average and anything negative is below average. The larger the number the better.

JENSEN ALPHA: A risk-adjusted performance measure that represents the average return on the fund over and above that predicted by the CAPM (Capital Asset Pricing Model), given the fund's beta and the average market return as represented by the benchmark. If the value is positive then the fund has outperformed the market and if it is negative then the opposite is true.

MODIFIED DURATION: Is a measure of risk for fixed interest securities as it predicts the sensitivity of the value of the fund's portfolio to a change in interest rates. The higher the value the greater the volatility of the fund's performance resulting from changes to interest rates. If the modified duration of a fund is 5 years then the average price movement of the fund resulting from a +/- 1% change in interest rates is 5%.

R²: This is a measure of how close the portfolio of a fund is correlated (or can be explained by) the performance of the benchmark. A result of 1 means a perfect correlation whilst 0 means there is effectively no relationship between the two performances. The degree of reliance that can be placed on the result is not linear, however. Generally, a correlation is only significant for values of 0.75 and above. Finally, it is worth noting that the higher the R² the greater the reliance that can be placed on the beta result.

RELATIVE VOLATILITY: Shows how much more or less volatile the fund has been relative to its benchmark which for all risk measures will be an index. For example if the fund's absolute volatility is 9% and the benchmark's is 10% then the relative volatility is 0.90.

TRACKING ERROR: Indicates how closely the fund tracks the benchmark. It is the standard deviation of the monthly returns of the fund divided by the monthly returns of its benchmark. The lower the number the closer the fund follows its benchmark.
